GiftFlowPay

USDC payments, rewards and payroll on Arc

Create once. Fund once. Distribute by rules.

Live on Arc Testnet

Paying many people in USDC is still manual

One transfer per person

Paying 100 people means 100 transactions, 100 addresses to check and a spreadsheet to reconcile.

Recipients cannot see the money is there

A promise of payment is not a funded payment. Trust is the only guarantee.

Leftovers need chasing

Unclaimed rewards sit in a wallet that someone has to remember to clean up.

50 to 100

recipients in one campaign: the first launch GiftFlowPay is built to handle.

Create once. Fund once. Distribute by rules

1

Create

Name the campaign, set the claim window and choose how people get paid.

2

Fund

One transaction locks the full USDC total in the contract. Allocations can never exceed it.

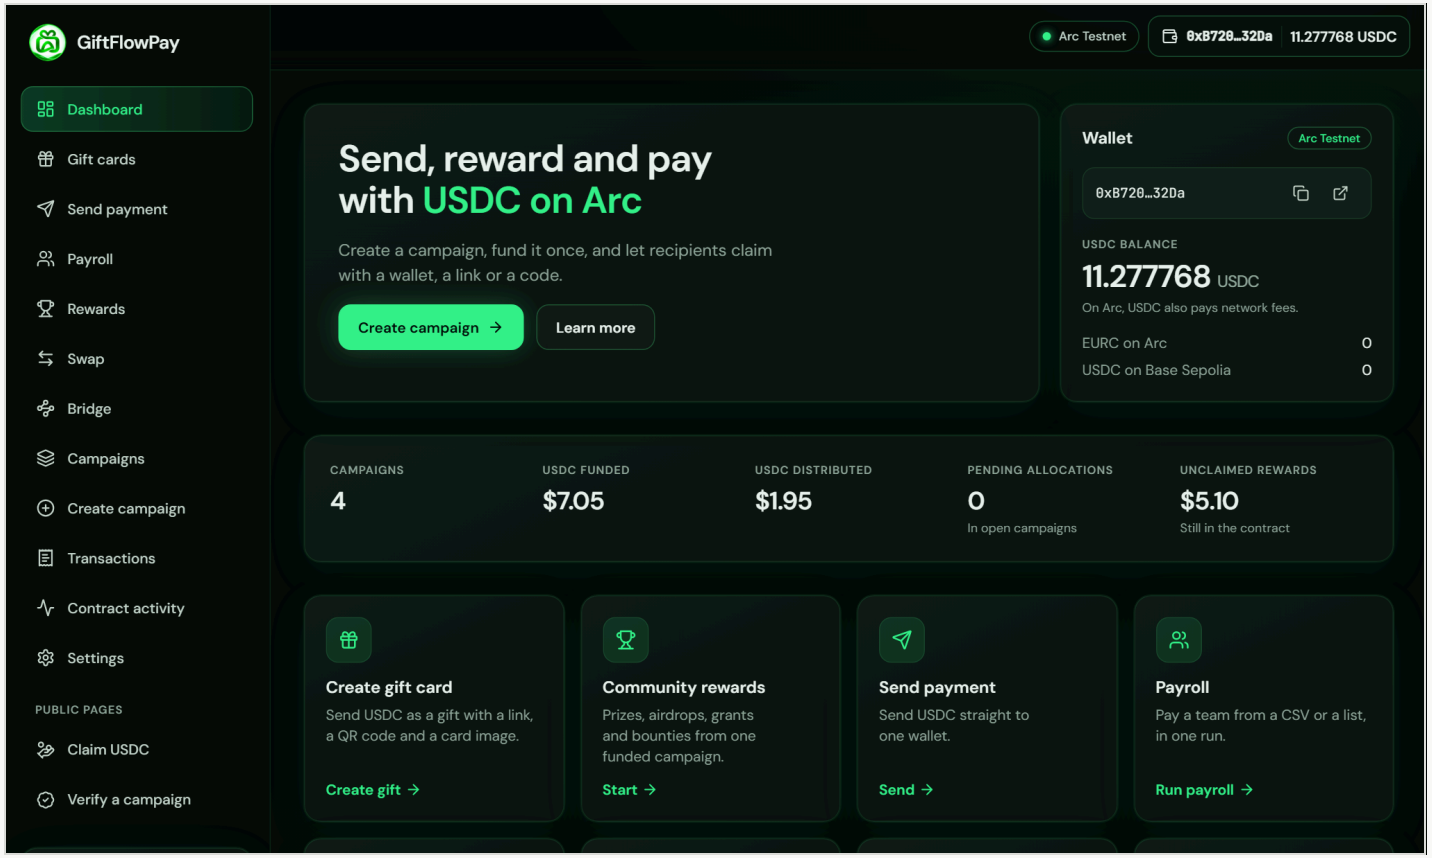

3

Distribute

Recipients claim with a wallet, a link or a code. Unclaimed USDC returns to you after the deadline.

Non-custodial. No database. No backend. Everything that matters lives onchain on Arc.

One dashboard for every payment

Dashboard on Arc Testnet: wallet, balances, totals and actions

Your wallet, live

USDC, EURC and Base Sepolia balances are read from the chains.

Real totals

Funded, distributed, pending and unclaimed amounts come from the contract.

No sign-up

Connect an Arc wallet and go. No account, no backend, no stored data.

Three ways to pay people

Wallet list

You know each wallet. Everyone opens one page, connects and claims, or you send to all of them.

Best for salaries and DAO payouts

One shared link

Equal shares with one link. Anyone who has it claims one share until none are left.

Best for open giveaways

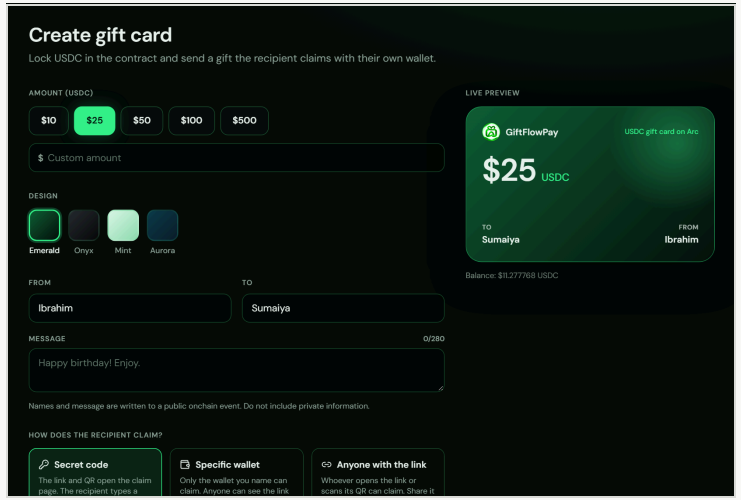

Secret codes

Equal shares with one personal code per person. Each code works once.

Best for exactly one share each

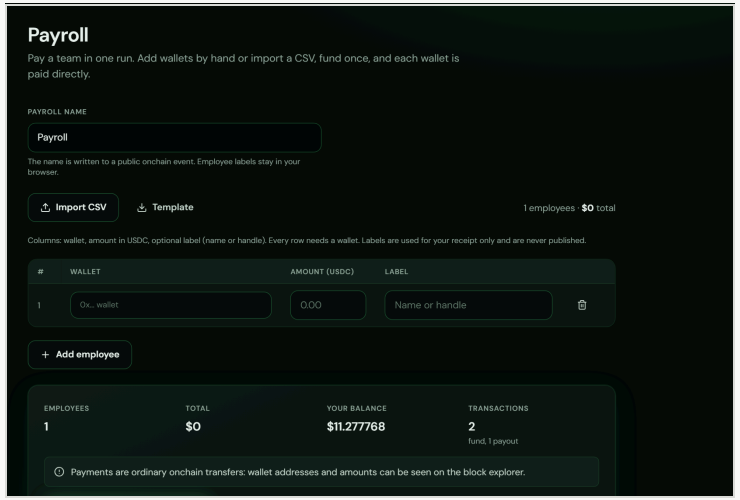

Same contract and same guarantees in every mode. Pick one per campaign.

Gift cards, payroll and payments

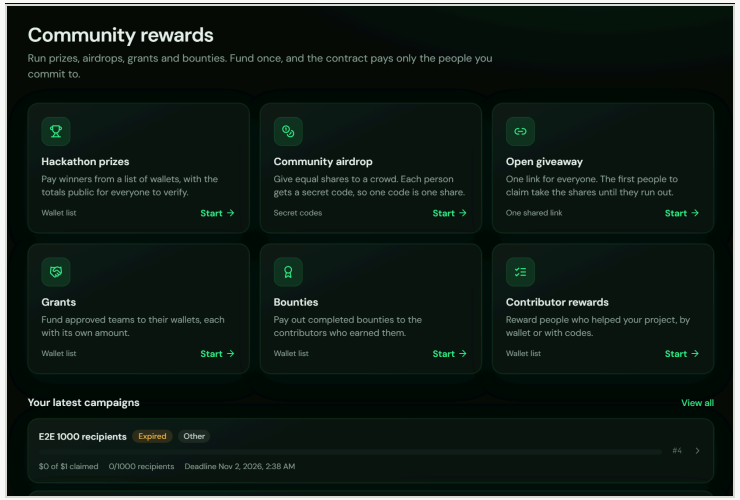

Gift cards

Pick an amount and a design, then share a link, a QR code or a card image. A secret code, a named wallet or a private link claims it.

Payroll

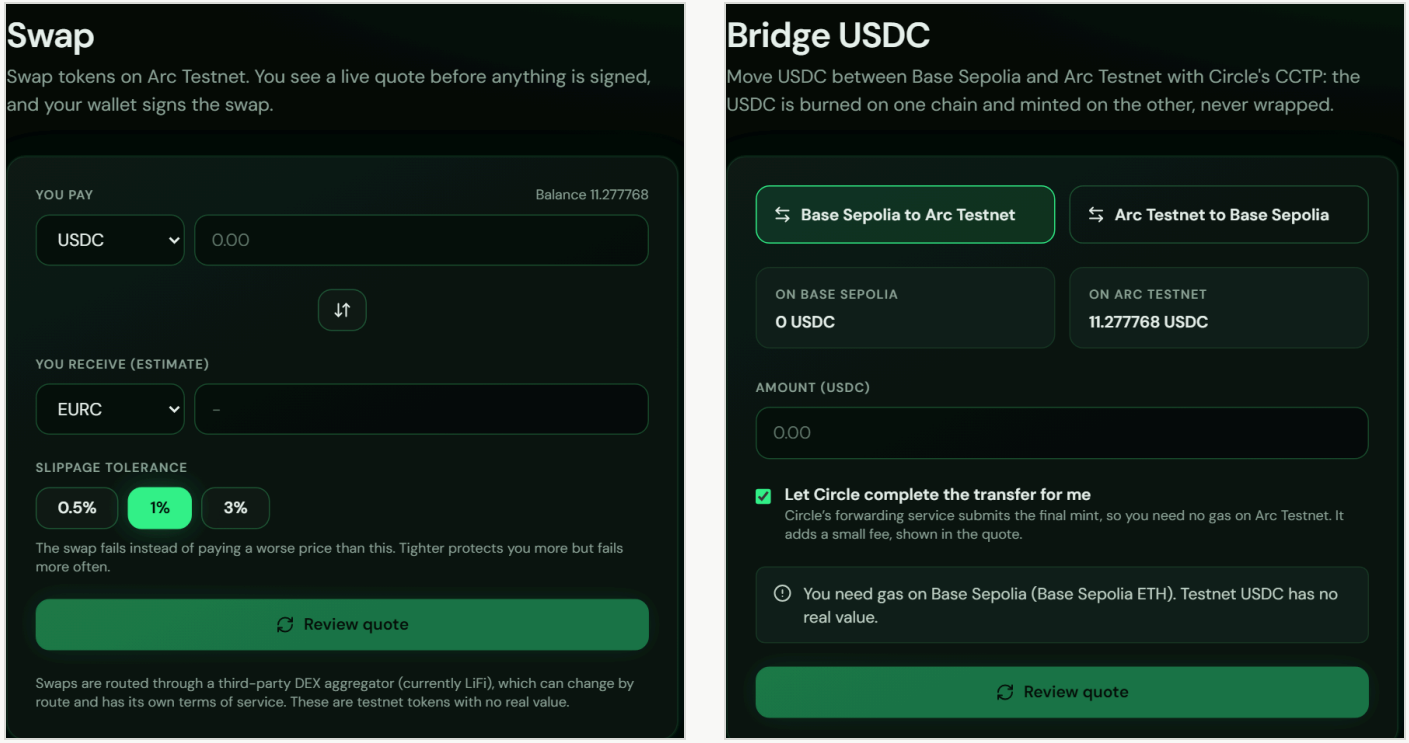

Add employees or import a CSV. Fund once, pay in batches of 50, resume safely, and download a receipt.

Rewards and payments

Start a hackathon, airdrop, grant or bounty from a preset. Send USDC to one wallet with address checks and a fee estimate.

Swap and bridge, with live quotes

Swap on Arc Testnet and the Base Sepolia to Arc bridge

Quote before you sign

USDC and EURC quotes come live from Circle App Kit. Nothing is hard-coded.

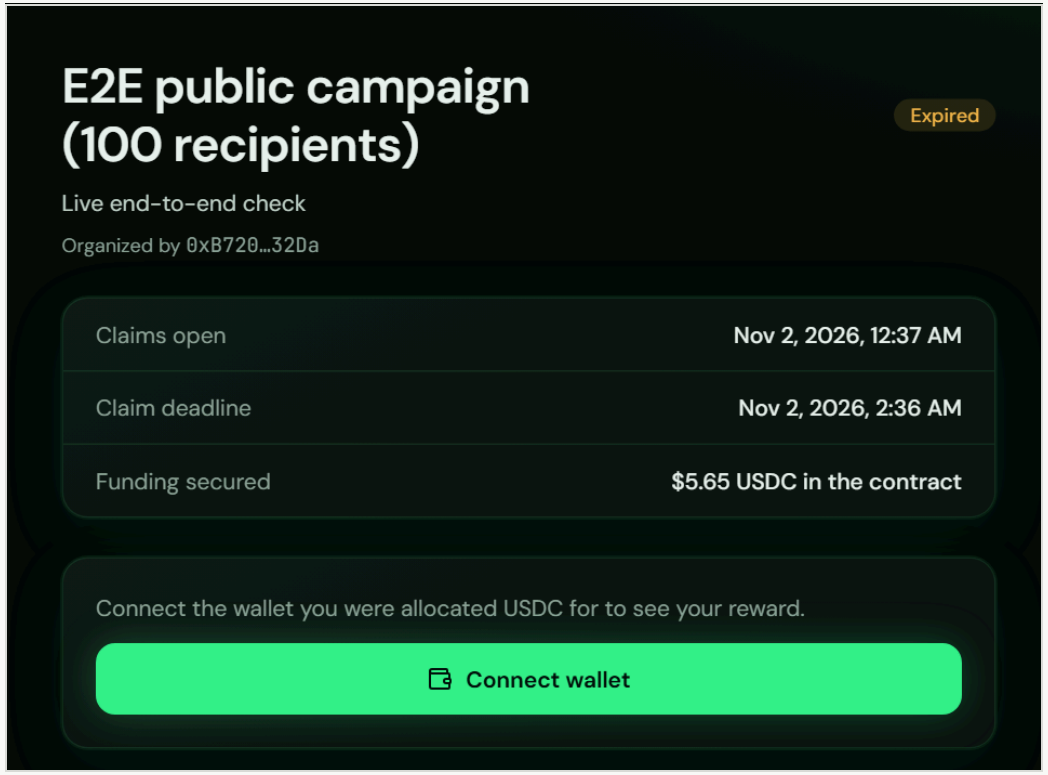

CCTP bridge

USDC is burned on one chain and minted on the other, never wrapped. Every step is shown.

Resume, never repeat

If a step fails, continue from it instead of starting over.

Claiming takes one wallet and one click

Claim page of a live campaign. This one has expired, so claiming is closed.

Connect the wallet

The page shows your reward and the deadline once your wallet is connected.

Eligibility is enforced onchain

The contract checks the proof and the wallet. A hidden button is never the only guard.

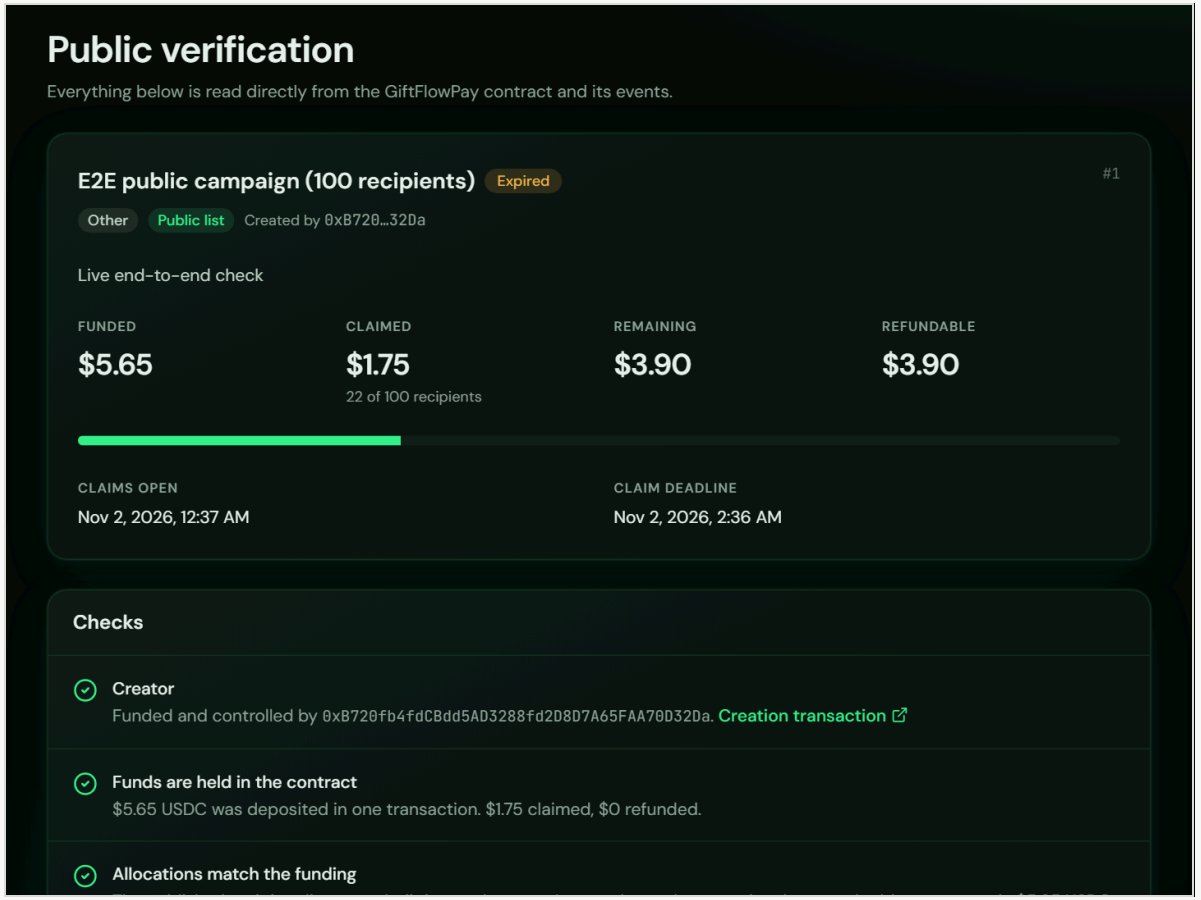

One claim per allocation

Duplicate and replayed claims are rejected by the contract.

USDC goes straight to you

No middleman holds funds. Success shows only after the chain confirms.

Anyone can verify a campaign

Campaign #1: 100 recipients on Arc Testnet

Funded, claimed, remaining

Read live from the contract, with no wallet needed.

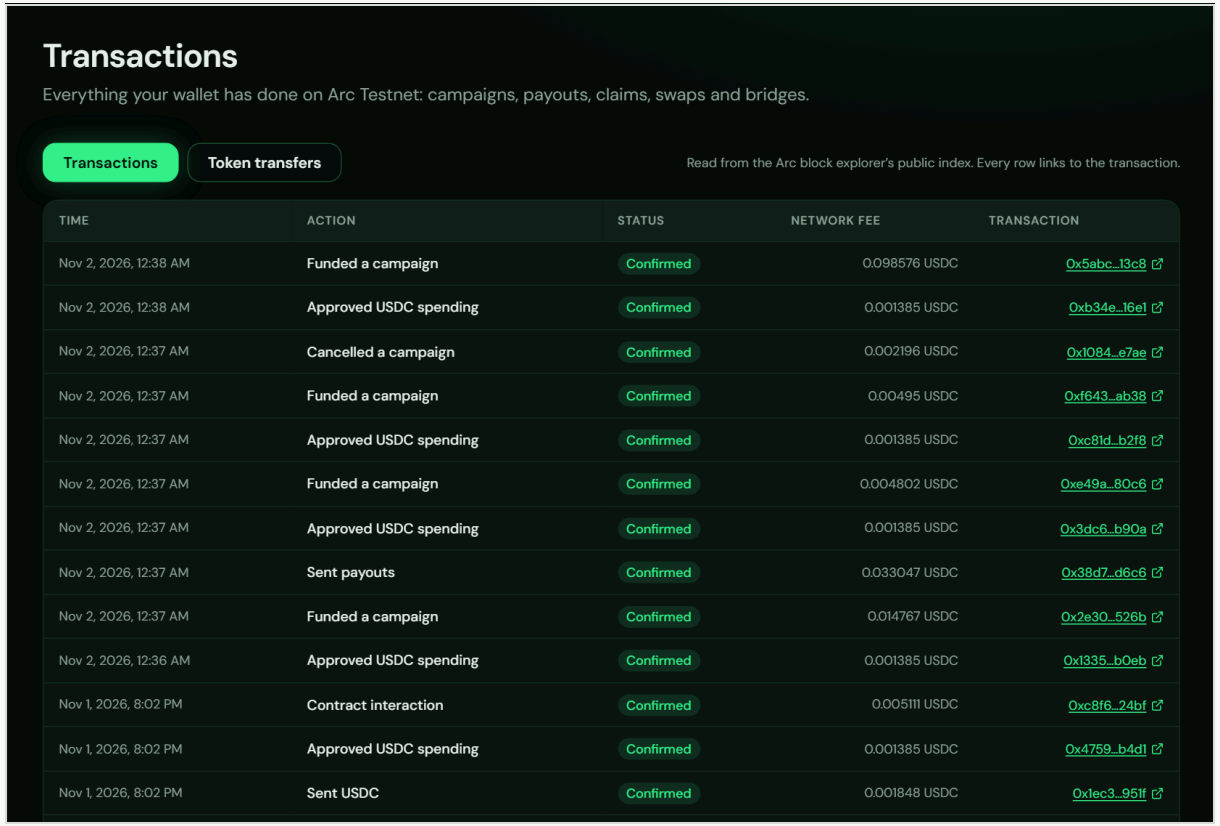

Allocations match the funding

The recipient list is rebuilt in your browser and compared with the onchain commitment.

Every transaction is linked

Creation, claims and refunds point to the Arc block explorer.

History and control for organizers

Transactions

Everything your wallet has done on Arc Testnet: campaigns, payouts, claims, swaps and bridges.

Transactions | Token transfers

Read from the Arc block explorer's public index. Every row links to the transaction.

Wallet history: each transaction labelled, with status, fee and explorer link

Labelled history

Funded, claimed, paid out, refunded, approved, swapped: each in plain words.

Refund after the deadline

Unclaimed USDC returns to the funding wallet, once.

Cancel before it starts

Scheduled campaigns can be cancelled for a full refund.

Pause never traps funds

Refunds and cancellations still work while paused.

Security is enforced by the contract

Safe transfers

Reentrancy guards, SafeERC20 and state updated before any transfer.

Single-use claims

A bitmap marks every claimed allocation. No duplicates, no replays.

Wallet-bound claims

Signatures name the receiving wallet, so a copied transaction cannot redirect funds.

Funding equals allocation

A Merkle sum tree proves allocations add up to the deposited total.

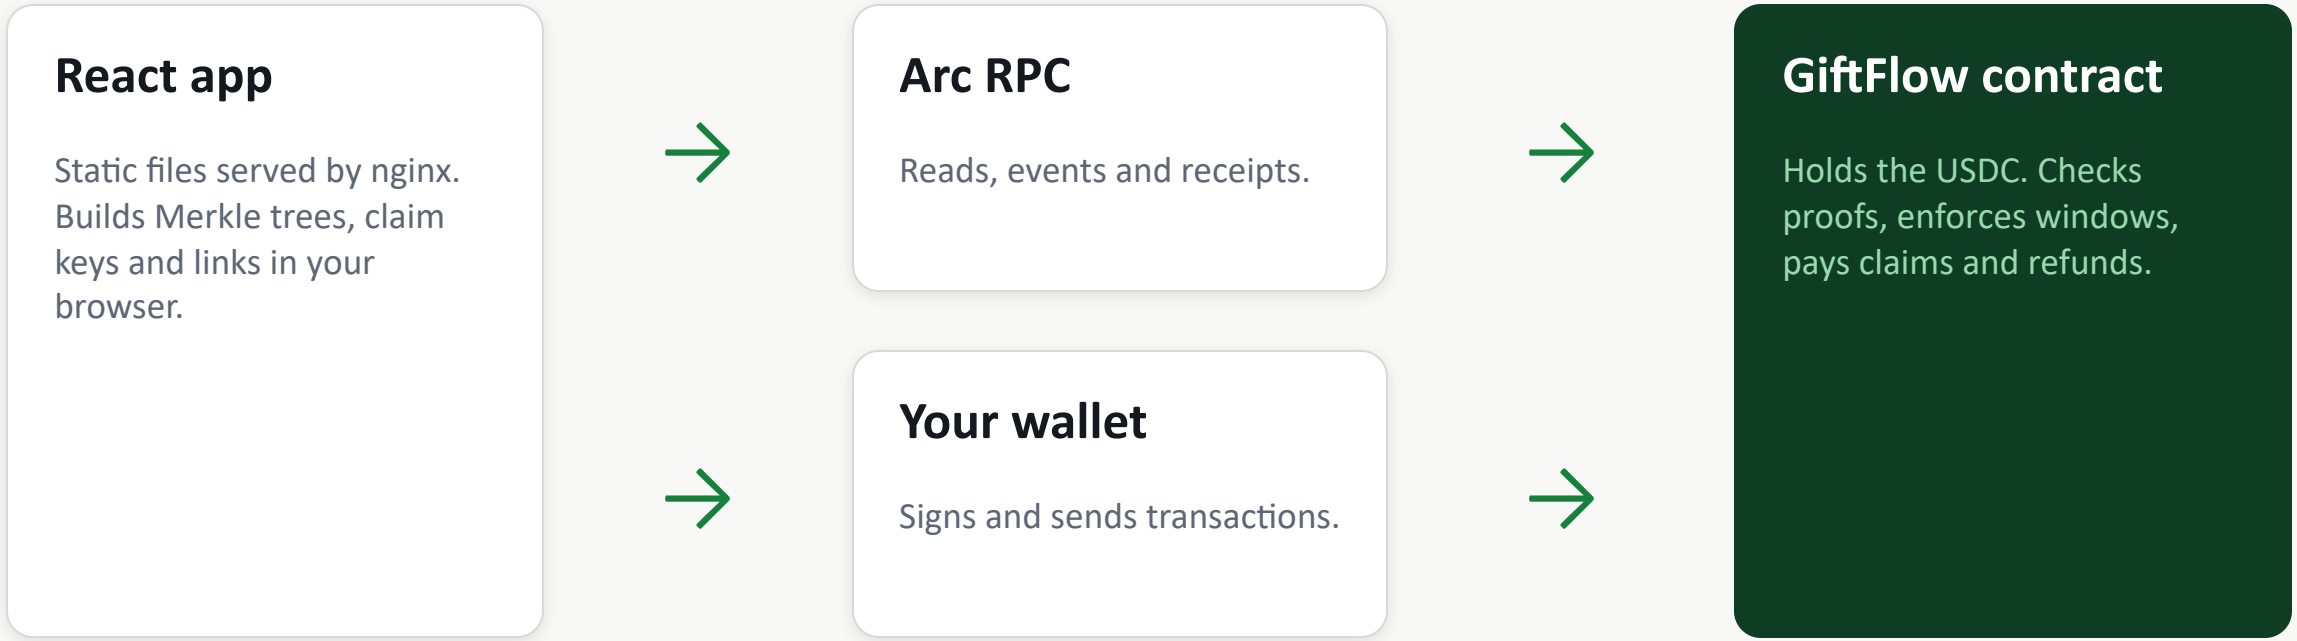

Safe refunds

Creator only, after expiry, once. Works even while paused.

No operator backdoor

The owner can pause and set a cap. It cannot withdraw funds or edit campaigns.

No database, no backend

State lives in contract storage and events. The browser stores three interface preferences only.

Tested before it holds real money

123

contract tests, run at 10,000 fuzz runs and 1,024 invariant runs

98.7%

line coverage of the contract

10

local-chain scenarios: the app against the real contract, incl. 100 codes and a 100-employee payroll

59

frontend tests, including a QR code scanned back to its link

Proven on Arc Testnet

A live script created campaign #1 on the real contract; 22 of its 100 allocations were claimed. Live swap and bridge quotes were checked read-only.

Not yet done

An independent security audit, a funded live run of every flow, and any mainnet deployment.

Ready to host and easy to run

Run it anywhere

- Docker image: a Vite build served by nginx
- docker-compose.yml ready for Coolify
- One build variable: the contract address
- Health check, security headers and CI included

Built with

Solidity	**OpenZeppelin**	**Foundry**
React 18	**Vite**	**TypeScript**
Tailwind CSS	**wagmi**	**App Kit**

Arc Testnet, chain 5042002, USDC with 6 decimals.

What comes next

Independent audit

A third-party review before real value is held.

Company management

Roles for teams: a Safe multisig or new contracts, to be decided.

Recurring payroll

Scheduled payouts need a new PayrollManager contract.

Embedded-wallet login

Google and email sign-in through a wallet provider.

WalletConnect

Needs a WalletConnect project ID.

Mainnet

Only after the audit and an explicit go-ahead.

Everything not built, and why, is listed in docs/feature-status.md.

Create once. Fund once. Distribute by rules.

GiftFlowPay: USDC payments, rewards and payroll on Arc

Full documentation is in the docs folder of the repository.
